## Network layer: "data plane" roadmap

- Network layer: overview
  - data plane
  - control plane
- What's inside a router
  - input ports, switching, output ports
  - buffer management, scheduling
- IP: the Internet Protocol
  - datagram format
  - addressing
  - network address translation
  - IPv6

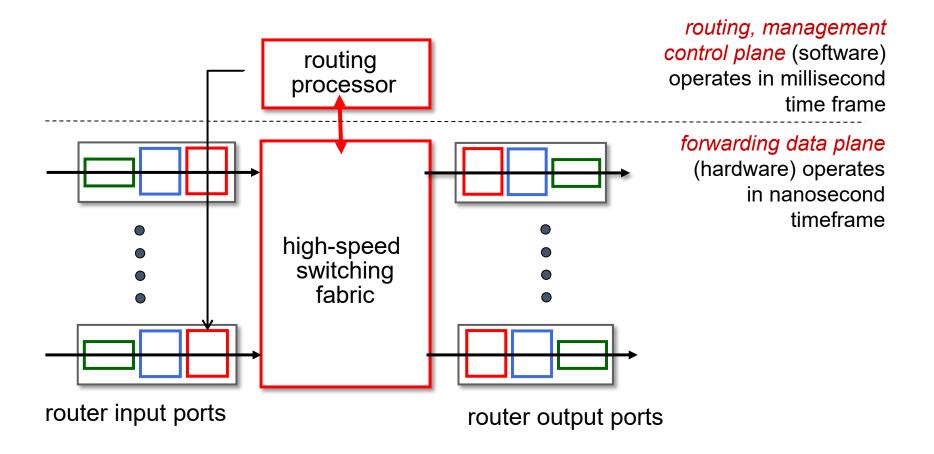

- Generalized Forwarding, SDN
  - Match+action
  - OpenFlow: match+action in action
- Middleboxes

### Router architecture overview

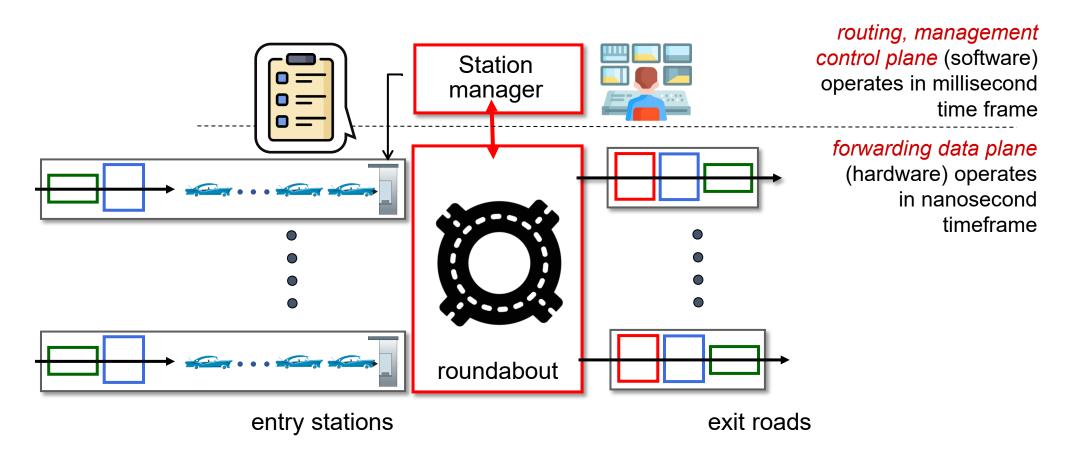

high-level view of generic router architecture:

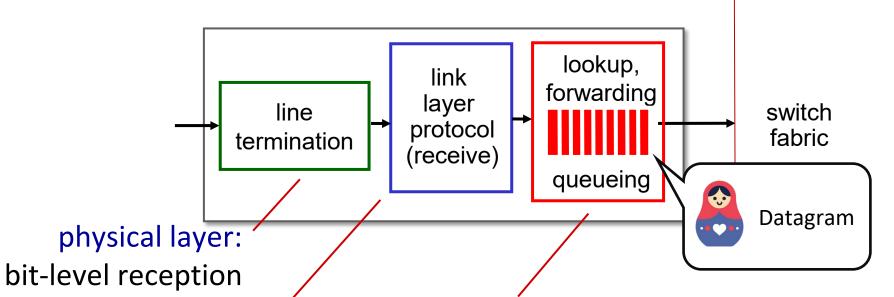

### Router architecture overview

analogy view of generic router architecture:

# Input port functions

#### link layer:

e.g., Ethernet (chapter 6)

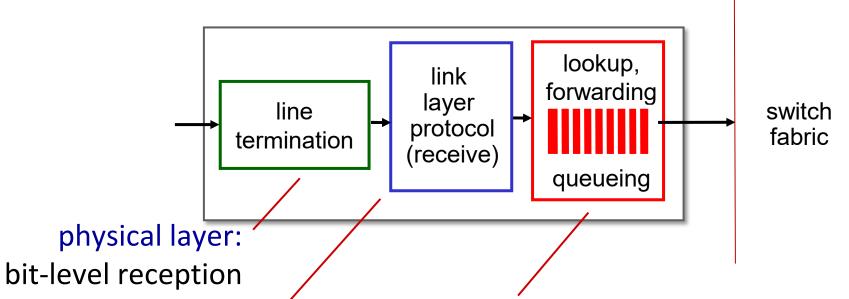

#### decentralized switching:

- using header field values, lookup output port using forwarding table in input port memory ("match plus action")
- goal: complete input port processing at 'line speed'
- input port queuing: if datagrams arrive faster than forwarding rate into switch fabric

## Input port functions

link layer:

e.g., Ethernet (chapter 6)

#### decentralized switching:

- using header field values, lookup output port using forwarding table in input port memory ("match plus action")
- destination-based forwarding: forward based only on destination IP address (traditional)
- generalized forwarding: forward based on any set of header field values

# Destination-based forwarding

forwarding table					
Destination Address Range					Link Interface
11001000 through	00010111	000 <mark>10000</mark>	00000000		n
11001000 through	00010111	000 <mark>10000</mark>	00000100		3
-	00010111	000 <mark>10000</mark>	00000111		3
11001000	00010111	000 <mark>11000</mark>	11111111		
11001000 through	00010111	000 <mark>11001</mark>	0000000		2
	00010111	000 <mark>11111</mark>	11111111		
otherwise					3

Q: but what happens if ranges don't divide up so nicely?

#### longest prefix match

when looking for forwarding table entry for given destination address, use *longest* address prefix that matches destination address.

Destination .	Link interface			
11001000	00010111	00010***	*****	0
11001000	00010111	00011000	*****	1
11001000	00010111	00011***	*****	2
otherwise	3			

#### examples:

which interface?	10100001	00010110	00010111	11001000
which interface?	10101010	00011000	00010111	11001000

#### longest prefix match

11001000

when looking for forwarding table entry for given destination address, use *longest* address prefix that matches destination address.

11001000 00010111 00010	
11001000 00010111 00010*** *****	0
11001000 0000111 00011000 *****	1
11001000 match! 1 00011*** ******	2
otherwise	3

examples:

 00010111
 00010
 10100001
 which interface?

 00010111
 00011000
 10101010
 which interface?

#### longest prefix match

when looking for forwarding table entry for given destination address, use *longest* address prefix that matches destination address.

Destination .	Link interface			
11001000	00010111	00010***	*****	0
11001000	00010111	00011000	*****	1
11001000	00010111	00011***	*****	2
otherwise	1			3
	المامحمو			

examples:

11001000	match!	00010110	10100001	which interface?
11001000	00010111	00011000	10101010	which interface?

#### longest prefix match

when looking for forwarding table entry for given destination address, use *longest* address prefix that matches destination address.

Destination A	Link interface			
11001000	00010111	00010***	*****	0
11001000	00010111	00011000	*****	1
11001000	0000111	00011***	*****	2
otherwise	match!			3

examples:

11001000 000 0111 00010110 10100001 which interface?

11001000 00010111 00011000 10101010 which interface?

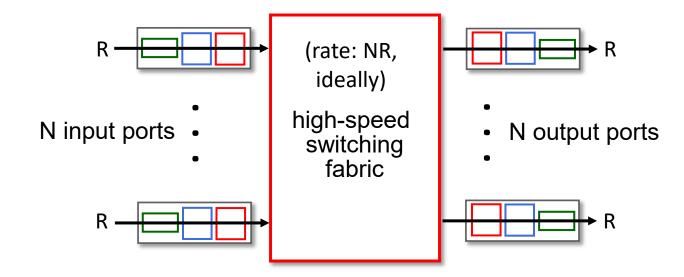

- we'll see why longest prefix matching is used shortly, when we study addressing
- longest prefix matching: often performed using ternary content addressable memories (TCAMs)
  - content addressable: present address to TCAM: retrieve address in one clock cycle, regardless of table size
  - Cisco Catalyst: ~1M routing table entries in TCAM

# Switching fabrics

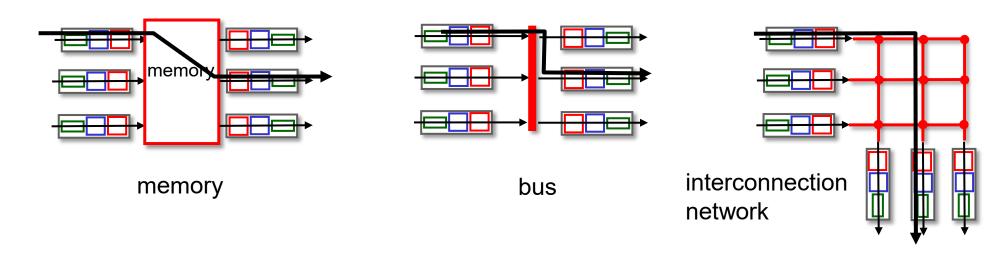

- transfer packet from input link to appropriate output link
- switching rate: rate at which packets can be transfer from inputs to outputs
  - often measured as multiple of input/output line rate
  - N inputs: switching rate N times line rate desirable

# Switching fabrics

- transfer packet from input link to appropriate output link
- switching rate: rate at which packets can be transfer from inputs to outputs
  - often measured as multiple of input/output line rate
  - N inputs: switching rate N times line rate desirable
- three major types of switching fabrics:

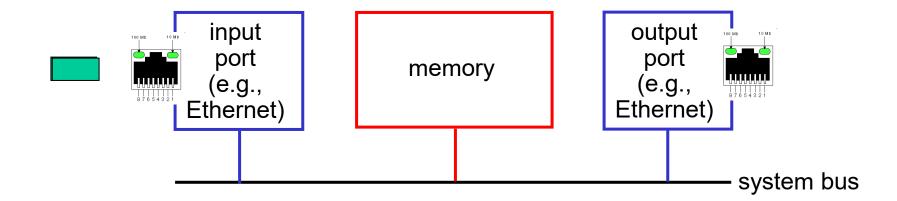

# Switching via memory

#### first generation routers:

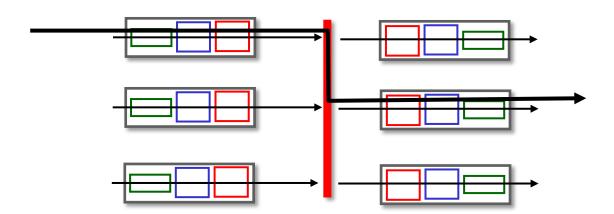

- traditional computers with switching under direct control of CPU
- packet copied to system's memory
- speed limited by memory bandwidth (2 bus crossings per datagram)

# Switching via a bus

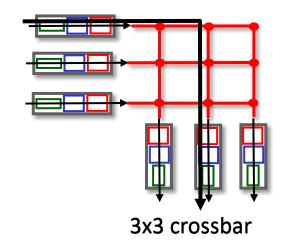

- datagram from input port memory to output port memory via a shared bus
- bus contention: switching speed limited by bus bandwidth
- 32 Gbps bus, Cisco 5600: sufficient speed for access routers

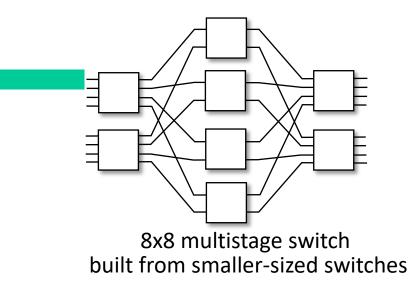

# Switching via interconnection network

- Crossbar, Clos networks, other interconnection nets initially developed to connect processors in multiprocessor
- multistage switch: nxn switch from multiple stages of smaller switches
- exploiting parallelism:
  - fragment datagram into fixed length cells on entry
  - switch cells through the fabric, reassemble datagram at exit

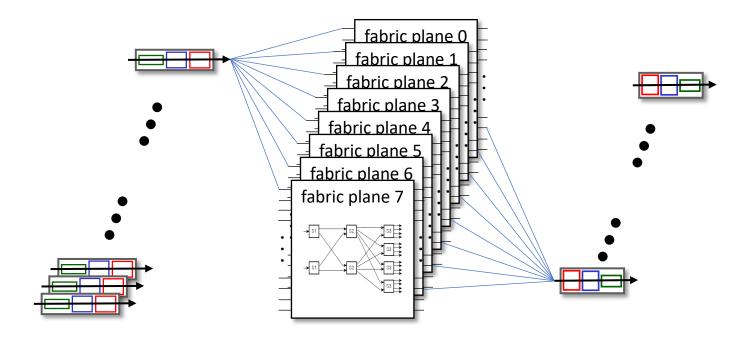

# Switching via interconnection network

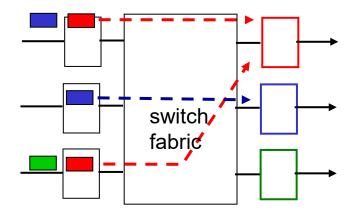

- scaling, using multiple switching "planes" in parallel:
  - speedup, scaleup via parallelism
- Cisco CRS router:
  - basic unit: 8 switching planes
  - each plane: 3-stage interconnection network
  - up to 100's Tbps switching capacity

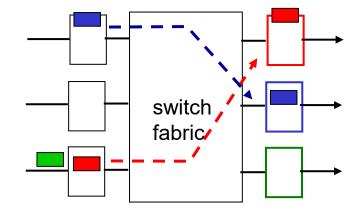

## Input port queuing

- If switch fabric slower than input ports combined -> queueing may occur at input queues
  - queueing delay and loss due to input buffer overflow!
- Head-of-the-Line (HOL) blocking: queued datagram at front of queue prevents others in queue from moving forward

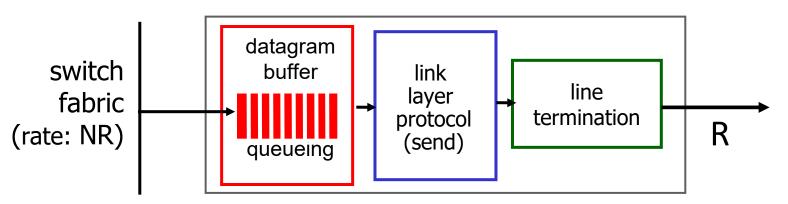

output port contention: only one red datagram can be transferred. lower red packet is *blocked* 

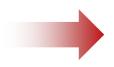

one packet time later: green packet experiences HOL blocking

## Output port queuing

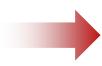

Buffering required when datagrams arrive from fabric faster than link transmission rate. Drop policy: which datagrams to drop if no free buffers?

Datagrams can be lost due to congestion, lack of buffers

 Scheduling discipline chooses among queued datagrams for transmission

Priority scheduling – who gets best performance, network neutrality

## Output port queuing

- buffering when arrival rate via switch exceeds output line speed
- queueing (delay) and loss due to output port buffer overflow!

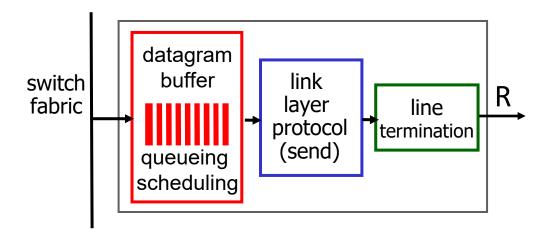

## How much buffering?

- RFC 3439 rule of thumb: average buffering equal to "typical" RTT (say 250 msec) times link capacity C
  - e.g., C = 10 Gbps link: 2.5 Gbit buffer
- more recent recommendation: with N flows, buffering equal to

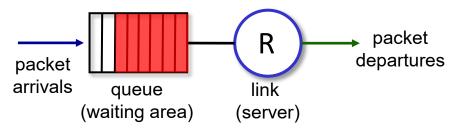

$$\frac{\mathsf{RTT} \cdot \mathsf{C}}{\sqrt{\mathsf{N}}}$$

- but too much buffering can increase delays (particularly in home routers)
  - long RTTs: poor performance for real-time apps, sluggish TCP response
  - recall delay-based congestion control: "keep bottleneck link just full enough (busy) but no fuller"

## **Buffer Management**

#### Abstraction: queue

#### buffer management:

- drop: which packet to add, drop when buffers are full
  - tail drop: drop arriving packet
  - priority: drop/remove on priority basis
- marking: which packets to mark to signal congestion (ECN, RED)

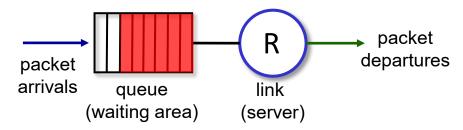

## Packet Scheduling: FCFS

packet scheduling: deciding which packet to send next on link

- first come, first served
- priority
- round robin
- weighted fair queueing

#### Abstraction: queue

FCFS: packets transmitted in order of arrival to output port

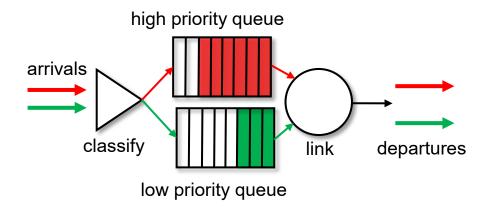

- also known as: First-in-firstout (FIFO)
- real world examples?

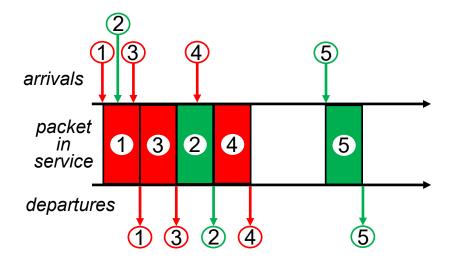

## Scheduling policies: priority

#### Priority scheduling:

- arriving traffic classified, queued by class
  - any header fields can be used for classification
- send packet from highest priority queue that has buffered packets
  - FCFS within priority class

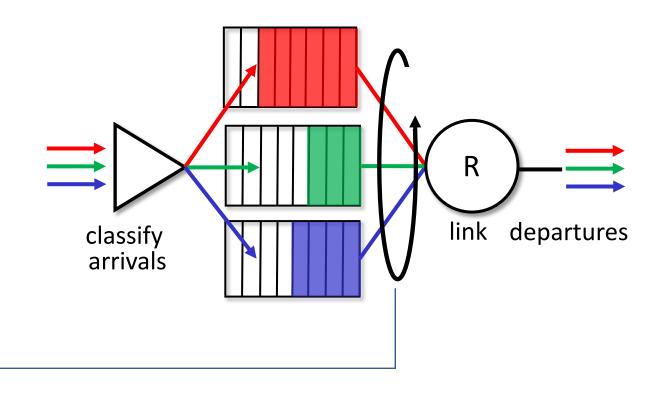

## Scheduling policies: round robin

#### Round Robin (RR) scheduling:

- arriving traffic classified, queued by class
  - any header fields can be used for classification
- server cyclically, repeatedly scans class queues, sending one complete packet from each class (if available) in turn

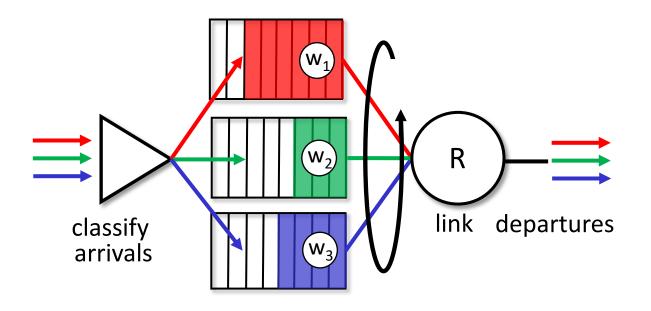

# Scheduling policies: weighted fair queueing

#### Weighted Fair Queuing (WFQ):

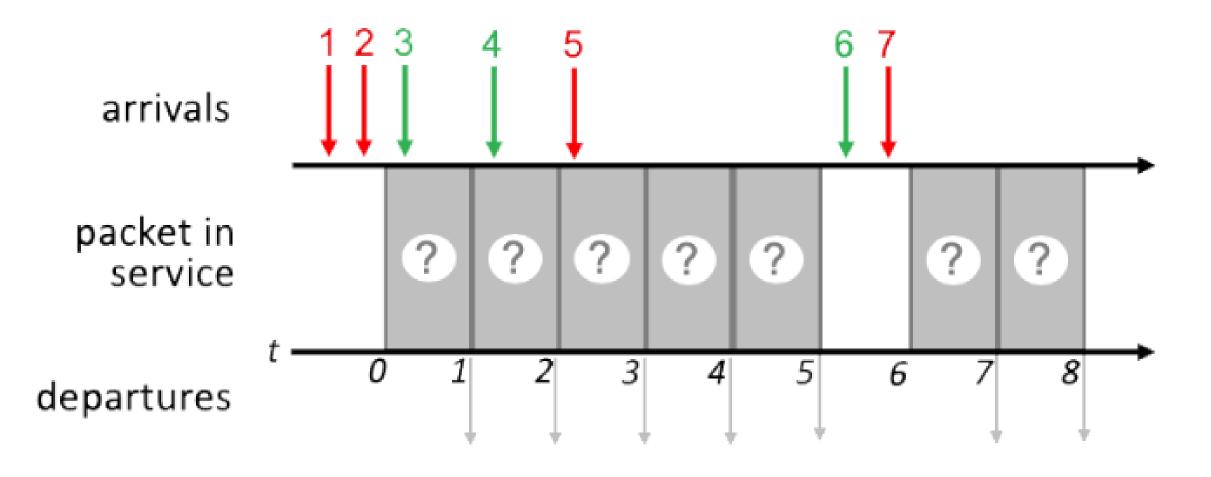

- generalized Round Robin
- each class, i, has weight, w<sub>i</sub>, and gets weighted amount of service in each cycle:

$$\frac{w_i}{\sum_j w_j}$$

 minimum bandwidth guarantee (per-traffic-class)

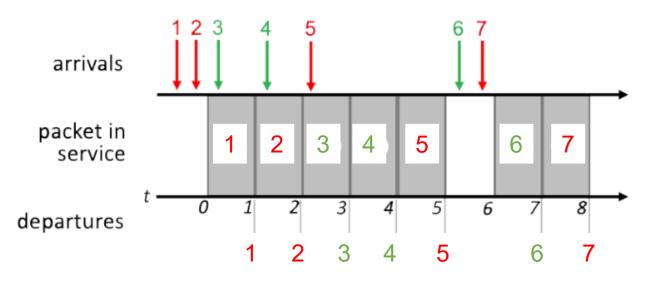

## Quiz

## FCFS Scheduling

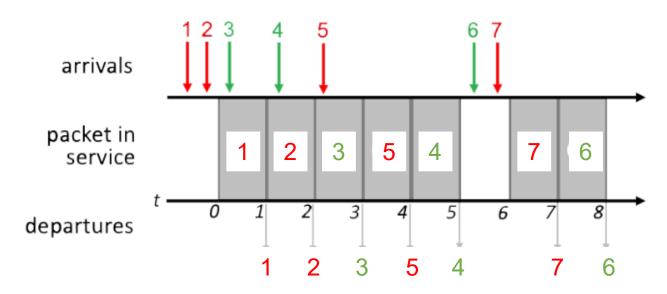

Transmit order the same as packet arrival order of 1 2 3 4 5 6 7

1234567

## **Priority Scheduling**

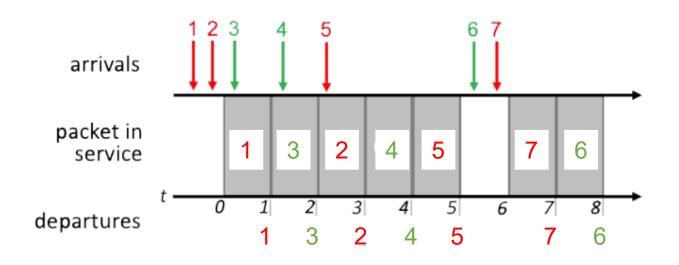

1235476

- Time 0: 1, 2 in queue, transmit 1
  - FCFS within same priority
- Time 1: 2, 3 in queue, transmit 2
- Time 2: 3, 4 in queue, transmit 3
  - FCFS within same priority
- Time 3: 4, 5 in queue, transmit 5
- Time 4: 4 in queue, transmit 4
- Time 6: 6, 7 in queue, transmit 7
- Time 7: 6 in queue, transmit 6

## Round Robin Scheduling

1324576

- Red starts each round if there are both red and green packets ready to transmit after an empty slot, i.e., (red, green) in each round
- Time 0-1: 1<sup>st</sup> round: (1, 3)
- Time 2-3: 2<sup>nd</sup> round: (2, 4)
- Time 4-5: 3<sup>rd</sup> round: (5, null)
  - No green packets ready
- Time 6-7: 4<sup>th</sup> round: (7, 6)
